

# CS4248 Final Report Template

A01234567X, A02345678Y

Group XX

Mentored by YY

{a01234567, a02345678}@u.nus.edu

## Abstract

This document is a template for the NUS CS4248 Natural Language Processing group project final report, which is limited to eight A4-sized pages for the main report body. This document contains the best practices for the group project final report, a marking rubric (§1) and formatting instructions for the report (§3). It also includes a list of frequently asked questions about CS4248 projects, included as Appendix B. The document itself conforms to its own specifications, and is therefore an example of what your report should look like.

You can (and should) access the live version of this file through the URL below: <https://www.overleaf.com/read/spjdcnpvcgyk>. This version you're reading is version 230312 (2023 March 12).

## 1 Report Best Practices

Your group report is **strictly** limited to eight pages<sup>1</sup> and summarises all of your group's understanding of your problem, models, experimental results and insights. Typically, such (empirical/experimental) scientific reports for natural language processing follows a five- to six-section format (suggested length in parentheses, for a **eight**-page limit; do not feel compelled to match these suggested lengths), as follows:

1. **Introduction** (1/2–1 page): Motivate your work, state the problem statement clearly (inputs and outputs), and summarise your key contributions. Optional to include are a concluding textual navigation paragraph, and/or running (microanalysis) example.
2. **Related Work / Background** (1/2–1 1/2 pages): Implementation and experimentation that your group did in the project should be

<sup>1</sup>For the main body of the report: title, abstract and main sections. Backmatter does not count towards this limit.

based on others' experiences. Relate these relevant works to show that you are aware of best practices, and how your work builds upon them. Your report can call attention to gaps in the related work to motivate your work to as innovative and filling in knowledge that is lacking. This section typically features many citations to prior work and footnote references<sup>2</sup> to online datasets or software.

3. **Corpus Analysis & Method** (1–2 pages): Describe the different key useful approaches that yielded interesting findings here. You need not include all of your group's work if certain branches did not prove useful; those you can mention in an appendix. Describe the preprocessing, data collection, and the main methods used. You may also refer to your group's software repository in a footnote, if you host it online<sup>3</sup>.
4. **Experiments** (1–2 pages): This section gives the main experimental settings, such as the corpus used, (macroscopic) evaluations metrics and baselines first; then proceeds to show the key performance evaluation experimental results, usually through figures, tables or charts. Interpret the data in these artefacts as prose explanations in the body text.
5. **Discussion** (1–3 pages): Enumerate 2–3 specific research questions and your group's answer that give more depth and analysis to the main results. These can describe performance aspects to sub-populations of input or intended users; time, memory and compute costs and scaling; micro-analysis of specific

<sup>2</sup>Such as this one: <http://nlpprogress.com/>.

<sup>3</sup>An example would be a GitHub repository such as <https://github.com/knmnyn/cs4248-2120>. If you provide one, please ensure that you have at least a minimally-documented README.md file and organize your repository accordingly

071	input instances. At least one question should		
072	be related to the natural language aspect (in		
073	contrast to general machine learning) of your		
074	project and corpora.		
075	6. <b>Conclusion:</b> (1/4–1/2 page): This section is		
076	often abused as another chance to repeat the		
077	abstract or the introduction. Use this section		
078	instead to help summarize and lend insight to		
079	the reader, in light that they now have read the		
080	contents of the other sections. Limitations of		
081	your project, future directions also feature in		
082	this final section.		
083	Aside from these sections, there will be a short 100–		
084	200 word abstract at the beginning of the containing		
085	a summary of the work accomplished. The abstract		
086	usually contains a clear task statement, highlights		
087	of experiments and key findings of the work.		
088	Following the eight-page maximum length re-		
089	port body, there is unlimited space for you to in-		
090	clude materials — an ethical statement, references		
091	and appendices (in that order).		
092	It is recommended that you start with this format		
093	and permute it to your liking.		
094	<b>2 Marking Rubric</b>		
095	The marking of the project report follows a similar		
096	format to the <i>Intermediate Update</i> : Presentation,		
097	Content, and Miscellaneous. We will mark out of		
098	a total maximum mark of 100. Your grade and		
099	comments on the marking will be made available		
100	by Canvas Gradebook.		
101	<b>Report Presentation (25%):</b>		
102	• Motivation:		
103	– Does the report clearly outline of goals		
104	and questions addressed?		
105	– Is the motivation for your task clear, plau-		
106	sible and rational?		
107	– Is the problem statement well-defined us-		
108	ing appropriate NLP terminology?		
109	– Does the report state the importance, use-		
110	fulness, benefits of the work and the re-		
111	sults?		
112	• Structure		
113	– Does the report content flow logically?		
114	– Is it sufficiently well-organized to omit		
115	information that should be common		
116	knowledge to your peers?		
	– Do you relegate less important informa-	117	
	tion to an appropriate location (backmat-	118	
	ter, software repository, footnote)?	119	
	• Visualization	120	
	– Does the report use appropriate figures,	121	
	plots, and tables to justify preprocessing	122	
	steps, design decisions, motivating dis-	123	
	cussions and explanations?	124	
	• Presentation (more important)	125	
	– Does the prose, references, sections and	126	
	visuals all complement each other in de-	127	
	scribing the logical flow?	128	
	– Is any corpus analysis (exploratory data	129	
	analysis) done purposefully, to motivate	130	
	model or experimental design?	131	
	– Are any visuals appropriately-sized, cap-	132	
	tioned and legible? Do they serve	133	
	to better explain the material than an	134	
	equivalently-sized block of prose text?	135	
	– Do you correctly follow the formatting	136	
	instructions, length limitations and sub-	137	
	mission rules?	138	
	Do not just report numbers, but illustrate (with	139	
	figures, tables), and explain them. Do not	140	
	assume that your audience knows what your	141	
	numbers mean.	142	
	<b>Report Content (60%):</b>	143	
	• Originality	144	
	– What are the original elements done in	145	
	the project? (It's not necessary that no	146	
	group has done your task before, but	147	
	your report needs to reflect your ability	148	
	to think analytically and contribute novel	149	
	analysis.)	150	
	– Do you articulate how your work is novel	151	
	in light of the prior work?	152	
	• Relevance	153	
	– How strongly connected is the project to	154	
	this course?	155	
	– Do you use core concepts of NLP taught	156	
	from class?	157	
	• Related Work	158	
	– How strongly connected is the project to	159	
	this course?	160	

161	– Do you use core concepts of NLP taught from class?	Note that your performance need not be very high (e.g., 90%) if your data problem is hard.	209
162		But you should show improvement over some baseline approach. This includes conscientious efforts to improve performance.	210
163	– Do you present a study of related work to the task? (Formal academic references, useful web articles and posts material, and other related work should be considered in this aspect. Remember to cite explicitly.)		211
164			212
165			213
166			
167		• Results Interpretation (10%): How well are the evaluation results described and interpreted.	214
168			215
169	• Technical Justification (more important):		216
170	– Is your technical approach suitable to try to solve your proposed problem?	– Error analysis: Explain, with evidence, why the model may be performing poorly (or not as good as you wish).	217
171			218
172	– Is your technical approach valid for your task and dataset?	– Do you justify technically why your model is good or has improved? I.e., rationalize your approach’s performance effectiveness.	219
173			220
174	– Are there technical flaws in the execution of the approach?		221
175			222
176	– Do you describe the data / corpora that you collected in an appropriate manner? (Self-annotated data may need evidence that the annotations are replicable; i.e., interannotator agreement)	– Future improvements: Discuss how you may further improve your model.	223
177			224
178	– Are evaluations performed with the appropriate metrics and correctly interpreted?		225
179		You do not have to implement or test all your ideas, if too infeasible. Though discussing them helps to show your grading staff that you have good and valid ideas.	226
180			227
181			228
182			229
183		<b>Miscellaneous (15%):</b>	230
184	• Implementation (more important):	• Reproducibility	231
185	– Did you implement multiple models (baseline, and best)?	– Is the technical approach described clearly and sufficiently detailed for a peer to replicate? Is the evaluation method described clearly and detailed enough for a peer to replicate?	232
186			233
187	– Do you cleanly delineate what your group members coded as original work from public library or code repositories you used from others?	– Is your source code well-organized and any ancillary materials well documented?	234
188			235
189	– Did you implement or use the models correctly?	– Are your results easy to replicate by running documented commands or executing a notebook?	236
190			237
191	– Did you tune them appropriately, where resources allowed?		238
192			239
193			240
194			241
195	• Model Evaluation (more important):		242
196	– Do you address both macroscopic, dataset-wide level performance (e.g., F1 measures) as well as microscopic, individual instance level performance (careful error analysis with diagnosis)?	• Limitations	243
197		– Do you state the principal limitations of your work, such as the important aspects of the problem domain, and how these factors might be mitigated?	244
198	– Do you demonstrate improvement in performance from your model to another, such as a baseline model? (A baseline model may be an implementation of a simpler model or version of your model, or referenced from other literature — make sure to give appropriate citations).		245
199		• Backmatter	246
200		– Do you use the backmatter and supplemental materials (website, source code repository) effectively to complement the formal report body?	247
201		– Are your references bibliographically complete?	248
202			249
203			250
204			251
205			252
206			253
207			254
208			

- Did your group appropriately fill out the *Statement of Independent Work*?
- Did you properly acknowledge and document how AI tools played an appropriate role in your experimentation, coding and report?

**Late policy.** Please refer to the CS4248 website for late policy, in Canvas » Pages » Grading. In general, our course’s late policy is harsh to help our instructing staff mark in an efficient manner. To ensure your group does well, please turn in your report on time (.PDF version to the Canvas Assignment) by the deadline. If you envision that your group cannot meet the deadline and you wish to seek an extension, please do so well in advance of the deadline, and not after the deadline.

### 3 Report Formatting

This document is a  $\text{\LaTeX}$  sourced document, a common typesetting system used in research communities, and commonly used for many conferences for natural language processing research. As such we are using this typesetting system and the formatting (style) files common to best practices for communicating NLP research and outcomes. This template is hosted on the third-party cloud-based  $\text{\LaTeX}$  typesetting site, Overleaf, which you may decide to use if you’d like. Note that NUS has a sitewide license to this product so you can get professional features when using an NUS email address (e.g., ones ending in `u.nus.edu` for free).

To be clear, it is **not necessary** for your group to use  $\text{\LaTeX}$  to typeset your final report. You may use other software and reproduce (most of)<sup>4</sup> the template following the styles noted below.

1. If you are using a system other than  $\text{\LaTeX}$  (e.g., MS Word, Open Office, LibreOffice, Apple Pages), you will want to follow the guidelines in the rest of this section for the report format.
2. If you are using Overleaf/ $\text{\LaTeX}$ , you should simply be able to use the logical formatting tags directly — which should have been configured properly by the inclusion of the `acl.sty` and `acl_natbib.bst` style files — and ignore the rest of this section. Please see the  $\text{\LaTeX}$  source of this document

<sup>4</sup>In other software, it may be difficult to reproduce the margin line numbering, this is ok to omit.

for comments on other packages that may be useful.

Format your report to two columns to a page, A4 sized page only, in the manner these instructions are formatted. The exact dimensions for a page on A4 paper are:

- All (Left, right, top and bottom) margins: 2.5 cm
- Column width: 7.7 cm
- Column height: 24.7 cm
- Gap between columns: 0.6 cm

For reasons of uniformity, Adobe’s **Times Roman** font should be used.

Type of Text	Font Size	Style
paper title	15 pt	bold
author names	12 pt	bold
author affiliation	12 pt	
the word “Abstract”	12 pt	bold
section titles	12 pt	bold
document text	11 pt	
captions	11 pt	
abstract text	10 pt	
bibliography	10 pt	
footnotes	9 pt	

Table 1: Final Report Font guide. Captions generally should be self-sufficient to read the table or figure independently of the prose text of the report. Use bottom and top rulelines for proper formatting.

#### 3.1 The First Page

Center the title, author’s name(s) and affiliation(s) across both columns. Do not use footnotes for affiliations. Use the two-column format only when you begin the abstract.

**Title:** Place the title centered at the top of the first page, in a 15-point bold font. (For a complete guide to font sizes and styles, see Table 1) Long titles should be typed on two lines without a blank line intervening. Approximately, put the title at 2.5 cm from the top of the page, followed by a blank line, then each of your groupmates’ NUS student IDs, Replace the `XX` and `YY` placeholders with your two-digit Group ID (e.g., “01”) and project mentor’s name. Do not format title and section headings in all capitals as well except for proper

names (such as “BLEU”) that are conventionally in all capitals. The affiliation should an electronic mail address for at least one contact student.

Start the body of the first page 7.5 cm from the top of the page.

**Abstract:** Type the abstract at the beginning of the first column. The width of the abstract text should be smaller than the width of the columns for the text in the body of the paper by about 0.6 cm on each side. Center the word **Abstract** in a 12 point bold font above the body of the abstract. The abstract should be a concise summary of the general thesis and conclusions of the paper. It should be no longer than 200 words. The abstract text should be in 10 point font.

**Text:** Begin typing the main body of the text immediately after the abstract, observing the two-column format as shown in the present document. Do not include page numbers.

**Indent** when starting a new paragraph. Use 11 points for text and subsection headings, 12 points for section headings and 15 points for the title.

## 3.2 Sections

**Headings:** Type and label section and subsection headings in the style shown on the present document. Use numbered sections (Arabic numerals) in order to facilitate cross references. Number subsections with the section number and the subsection number separated by a dot, in Arabic numerals. Do not number subsections.

## 3.3 Citations

Output	natbib command
(Gusfield, 1997)	\citep
Gusfield, 1997	\citealp
Gusfield (1997)	\citet
(1997)	\citeyearpar

Table 2: Citation commands supported by the `acl.sty` style file. The style is based on the `natbib` package and supports all `natbib` citation commands.

Citations are bibliographic references to scholarly works. You may include references to documentary web pages, blog posts, reports, pre-prints as well. Note that references to general webpages or software (packages) as URLs are more appropriately given as footnotes.

Table 2 shows the syntax supported by the style files. We encourage you to use the `natbib` styles.

You can use the command `\citet` (cite in text) to get “author (year)” citations, like this citation to a paper by Gusfield (1997). You can use the command `\citep` (cite in parentheses) to get “(author, year)” citations (Gusfield, 1997). You can use the command `\citealp` (alternative cite without parentheses) to get “author, year” citations, which is useful for using citations within parentheses (e.g. Gusfield, 1997).

## 3.4 Backmatter

Backmatter are other materials that follow the main report body. They include the following:

**References.** Your group should cite all appropriate references that you need in your report. You may place an *unlimited* number of references to work that is relevant, beyond the page limit for the main report.

The `LATEX` and `BibTEX` style files provided roughly follow the American Psychological Association format. If your own `bib` file is named `custom.bib`, then placing the following before any appendices in your `LATEX` file will generate the references section for you:

```
\bibliographystyle{acl_natbib}
\bibliography{custom}
```

Many papers in natural language processing come from the ACL Anthology, the digital library for NLP, which Min ran for many years. You can obtain the complete ACL Anthology as a `BibTEX` file from <https://aclweb.org/anthology/anthology.bib.gz>. To include both the Anthology and your own `.bib` file, use the following instead of the above.

```
\bibliographystyle{acl_natbib}
\bibliography{anthology, custom}
```

**Statement of Independent Work.** Your group must include this section, to declare whether your group followed class policy. Refer to the example in this document’s backmatter.

**Ethical Statement.** An optional, unnumbered section. Refer to the example in this document’s backmatter.

**Acknowledgements.** An optional, unnumbered section. Refer to the example in this document’s backmatter.

**Appendices.** You are also allowed *unlimited pages* for appendices, but be aware that your teaching staff is not obligated to read or acknowledge these sources.

Use `\appendix` before any appendix section to switch the section numbering over to letters. See Appendix [A](#) for an example.

## Acknowledgements

Place any acknowledgements here. You can thank any people you contacted or sources that you used that are not bibliographic in nature.

This document has been adapted from the ACL Rolling Review Template (ACL ARR) by Min-Yen Kan. You may find the original template, which NUS has also contributed to in the past, here: <https://www.overleaf.com/latex/templates/acl-rolling-review-template/jxbhdzhmcpdm>. We have omitted much of the original document to cut down on verbiage.

Our final report grading rubric is based on a merger of guidelines from component courses CS5228 Knowledge Discovery and Data Mining and CS3244 Machine Learning.

## Statement of Independent Work

You **must** include the text of the two statements below in your group’s submitted work. Digitally sign your submission using your Student Numbers (starting with A...; N.B., not your NUSNET email identifier). This is a required section and is not part of the main body (doesn’t count towards your page limit).

1A. Declaration of Original Work. By entering our Student IDs below, we certify that we completed our assignment independently of all others (except where sanctioned during in-class sessions), obeying the class policy outlined in the introductory lecture. In particular, we are allowed to discuss the problems and solutions in this assignment, but

have waited at least 30 minutes by doing other activities unrelated to class before attempting to complete or modify our answers as per the class policy.

We have documented our use of AI tools (if applicable) in a following table, as suggested in the NUS AI Tools policy<sup>5</sup>. This particular document did not use any AI Tools to proofcheck and was constructed and edited purely by manual work.

1B. Exception to the Class Policy. We did not follow the CS4248 Class Policy in doing this assignment. This text explains why and how we believe we should be assessed for this assignment given the circumstances explained.

Signed, [Enter your Axxx Student IDs here]

## Ethical Statement

The optional ethical statement is an unnumbered section that comes after the references. Most projects may not need to include such a statement, but we include it here, as it is important to be aware that NLP research and experimentation needs to be conducted in an ethically acceptable manner.

It describes any pertinent issues with respect to the NL technology being described in the project work. These could include dual-use, data quality discussions, compute requirements, fair pay for annotators and evaluators, among other factors.

You may read more about these issues by reading the *Guidelines for Responsible NLP Research*<sup>6</sup> and consulting works on the ACL Ethics Reading List<sup>7</sup>.

## A Example Appendix

Optional appendices are the last item in the report.

If your group’s report is too long, working to best structure the core of the report (instead of technical details) in the main body and relegating details for replication in appropriate appendices is key.

Since you have unlimited pages for appendices, you can afford to make any plots or result tables larger in the appendices, but do ensure that key

<sup>5</sup><https://libguides.nus.edu.sg/new2nus/acadintegrity>, tab “AI Tools: Guidelines on Use in Academic Work”

<sup>6</sup><https://aclrollingreview.org/responsibleNLPresearch/>

<sup>7</sup><https://github.com/acl-org/ethics-reading-list>

results are in the report's main page limit rather than relegated here.

## B Project Frequently Asked Questions (FAQ)

*This section is sourced from the CS3244 Machine Learning module's Project FAQ.*

1. *Q: Just to be sure, for our project work, can we code in any language (i.e. R) other than python?*

A: Yes.

2. *Q: Does the project difficulty matters for the grading, e.g. taking the easy dataset versus doing something tagged as hard? Would we be graded based on the novelty or "importance" of the use case/problem our group comes up with?*

A: We aren't looking at technical complexity when grading the project. We state the notional technical difficulty of project dataset to help your team decide which type of project to take on. More difficult datasets usually involve more specific preprocessing, data normalization and usually (much) larger compute costs in manipulating large-scale data.

- What we are looking at is the learning that comes out of engaging in the project. We want to see you twist your mind and come up with interesting approaches to the problem of choice.
- We also do not place heavy emphasis on metrics like accuracy, log loss, precision, recall, etc.. We'd care more about questions like "why did you use XYZ Metric over ABC Metric for this problem?". Getting a +0.5 accuracy boost doesn't matter as much as why you chose to do ABC Technique that brought about that accuracy boost in the first place.
- We care more about how you communicate your findings to us in an interesting way like your analysis, your wins, your losses (pun not intended), etc.. That way, it shows us that you gained valuable experience from this project that you can apply to future projects.
- You are allowed to explore models not covered in class at your own discretion. We only teach you the fundamentals in hopes of making you comfortable with the math/concepts involved. Beyond that, you can look at more complex models and techniques not taught in CS4248 for your projects. But again, complexity is not the focus, communication and understanding the 2W1H (why, what, how) are.
- There isn't any true "novelty" in these projects *per se*. They are popular benchmarks found in the real world with increasing difficulty of use. We want you to have your own unique spin to these solutions (please do not copy-paste/plagiarise someone else's code from online) and present them in a way you and we (i.e. the teaching staff) understand.

These projects are for you in the long run, not us. Hope this helps.

3. *Q: What local compute do we have access to for our projects?*

A: Please take note that our class' reservation for compute nodes in SoC has now taken effect (from

26 Jan until 15 Apr). If your groups find it useful, you may start using it if you have previously registered an SoC UNIX ID. The nodes you may work with are `xgpf0-6` (i.e., use the command `ssh xgpf0.comp.nus.edu.sg` within SoC's network to reach the first of seven available servers). You may use other nodes but these compute resources are exclusively for our class' use. If you use these resources, please self-regulate and use a maximum of one (1) node per group. It is unfair if one group hogs all of the resources and makes the resources unavailable to others. Please be respectful and mindful that your group is one of many in our cohort and all groups should be able to utilize some of these resources.

4. *Q. Have any advice for experimentation?*

A: Sure. We recommend staging your experiments' time to execute to fit your working style. For example, we recommend having 3 granularities of time for your experiment execution: immediate (finishes within 1-3 minutes), coffee/tea break (finishes within 30-60 mins), overnight (as the name implies). Based on some initial runs, you should develop a good estimation for how long your pipeline takes for a certain data scale, and retrofit/sample data from your dataset to fit accordingly.

**Immediate** experiments should just to check that your code works with a tiny toy dataset without faults and to assess whether an experimental setting can be escalated to the next granularity.

**Coffee / Tea Break** experiments test those runs from the Immediate scale that reach your standard for trying on a larger dataset. These experiments can be set to run on a server with a medium-sized dataset that can complete independently while you are eating a meal, or taking a break to do other work or play. These validate your ideas on larger scale datasets without committing to training an entire dataset without knowing whether the results point appropriately in the proper direction – Min has seen many times that the "math works out (e.g., shape of matrices are fine) but which the computation is garbage (e.g., one off indexing errors) – so this scale mitigates this. These scale experiments need to be followed up with analysis to ensure that the results are as expected and appropriate.

**Overnight** (or longer) experimentation runs your training or testing at scale, for production or for final presentations or reports. Try not to do this scale of experimentation without having a good reason to believe it will succeed (i.e., don't run a large-scale experiment to try something out; you should have done that at the Coffee / Tea Break scale instead).

5. *Q: Is model performance and using and getting state-of-the-art performance an important output of our project?*

A: Generally, no. Good projects explain and teach, rather than just show good results. It is better to use simpler models where you can show that your understanding of the model, features, corpus and evaluation metrics interact to lead to the performance levels you observe. Merely swapping in a newer more advanced model and getting better results doesn't merit this understanding. Good and replicable results are nice-to-have in terms of grading criteria, but not must-haves.

6. *Q: Just want to check if our group's understanding of an ablation study is correct. If we have around 20 features that we engineered and a baseline model of previously proposed features, how do we efficiently conduct an*

639 ablation study? We are thinking of grouping the 20 fea- 707  
640 tures we have into a few groups to turn them on/off for 708  
641 the study. Is this the correct way? Should our angle 709  
642 start out from all features included to removing parts 710  
643 of it, or start from the baseline model and add features, 711  
644 since it's an "ablation" study. 712  
645 A: Yes, that would be appropriate. You can turn off a 713  
646 feature group, or some pre-/post- processing and see 714  
647 what the effects are. Before you do that, your team 715  
648 should hypothesize what you think would happen. This 716  
649 can help you hone your sense of understanding. A sci- 717  
650 entist does experimentation with a hypothesis in mind. 718  
651 Generally you have a final model and you turn off cer-  
652 tain features to study their (negative) impact on your  
653 final model. This allows you to argue for the necessity  
654 of all feature groups in your model.

- 655 7. *Q: I have some questions regarding the ablation studies* 720  
656 *we need to do for the project. Based on my understand-* 721  
657 *ing, the aim of ablation studies is to understand how*  
658 *our existing system (i.e. the feature engineering tech-*  
659 *niques+the models) work. And I remember you saying*  
660 *that it is about having hypothesis and finding ways to*  
661 *test them. So my first question is, do we have to have*  
662 *some form of "removal" to conduct ablation analysis?*  
663 *Or is it ok to analyse without "removal"?*

664 A: Yes that's correct. No you need not (always) do a  
665 removal (ablation) for analysis. It is just a common  
666 form. Both additive and ablative (removal) studies of  
667 feature classes are common. Ablation studies often form  
668 the basis for arguing that the model cannot have any of  
669 its elements removed without damaging a performance  
670 metric.

- 671 8. *Q: If the aim is to understand how our existing system*  
672 *works, how do we control the factors of the experiment?*  
673 *For example, if feature engineering technique A works*  
674 *well with a model, and we wanna know what is in A that*  
675 *makes this succeed, so we modify technique A into its*  
676 *variant C (with one feature removed), and then here's*  
677 *the question: do we feed the input processed using C*  
678 *into the model trained using A and see the change of*  
679 *results, or do we train a new model of the same structure*  
680 *on this input processed using C and then compare the*  
681 *results with inputs processed by A feeding into model*  
682 *trained using A?*

683 A: Yes, sometimes we refer to C as "C: Model A-<some  
684 feature>". The second method, train a new model.  
685 We compare the performance macroscopically (whole  
686 dataset, e.g., accuracy,  $F_1$ ) against the system trained  
687 with the output from A.

- 688 9. *Q: It was mentioned at the start of the sem that there*  
689 *was no real novelty in our projects, but there was nov-*  
690 *elty of project in the project presentation rubrics. Could*  
691 *you please clarify what novelty in the marking rubric*  
692 *truly stands for?.*

693 A: Indeed with many of our curated datasets, there  
694 has been much (informally) published past work. You  
695 should find, read and cite any past work in your pre-  
696 recorded presentation and add these links to the sup-  
697 plemental materials you prepare, so that the instruction  
698 staff can check accordingly. You should validate (by  
699 replication) performance figures from other papers or  
700 posts. You do original work by going beyond what  
701 others have reported. There are many ways you can go  
702 beyond the past work in your analyses and subsequent it-  
703 erative questioning and answering of your project work.  
704 Don't concentrate just on performance metrics but look  
705 for ways to connect what you've learned in lecture with  
706 your project.

Examples include:

- How do changes in your model architecture affect performance? Not just at the macro performance metrics but for individual (micro) and groups (meso) problem instances? 708
- How does changing some input instances mini- 709  
mally change the results for better or worse? 710
- Which features or model paradigm designs con- 711  
tribute the most towards performance and, more 712  
crucially, why? 713
- Why do certain models do better at certain in- 714  
stances and not for others? 715

## C Version History 719
